molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
apoptosis in cells withia normal system, by inhibiting binding between
Fas and its ligand. The products of the invention have anti-inflammatory,
anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
immunomodulatory, dermatological, immunosuppressive, thyromimetic,
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, saforgen's syndrome, permicious or hypoplastic
cheases associated with the Fas/Fas ligand system, especially systemic
clupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
corress, host disease, scleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
colls. They bind to both human and murine Fas, so can be evaluated in
murine disease models: (I) act on the active site of Fas, i.e. they mimic
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models: (I) act on the active site of Fas, i.e. they mimic
change a human anti-murine antibody response. This sequence represents
a humanised anti-ras antibody HegyA designed light chain which is used in ő 121 TFGQGTRLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180 61 QQKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLT1HPVEEEDAATYYCQQSNEDPR 120 Gaps 9 1 METDTILLWVLLLWVPGSTGDIVLTQSPGTLSLSPGERATLSCKASQSVDYDGDSYMNWY 60 181 GNSQESVTEQDSKDSTYSLSSTLTLSKADYEKHKVYACEVTHQGLSSPVTKSFNRGEC 238 ; 0 Length 238; Indels Score 1201; DB 21; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

monoclonal antibody 13-1 light chain - mouse
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Date: 04-Feb-1998 #sequence_revision 13-Mar-1998 #text_change 21-Jan-2000
C;Accession: JG5810
R;Akashi, S.; Kato, K.; Torizawa, T.; Dohmae, N.; Yamaguchi, H.; Kamachi, M.; Harada, Blochem Biophys. Res. Commun. 240, 566-572, 1997
A;Title: Structural characterization of mouse monoclonal antibody 13-1 against a porpare reference number: JG5810; MUID:98063277
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A; Accession: JC5810
A; Molecule type: protein
A; Residues: 1-218 <AKA.
C; Comment: This catalytic antibody has peroxidase oxidase. It is directed against a F; Superfamily: immunoglobulin V region; immunoglobulin homology
F; 16-94/Domain: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      If Kappa chain V region (clone 23.2) - mouse (fragment)

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This is the amino acid sequence of the MM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A. E. coli sank 73697 harbors plasmid phsGwMe carrying a fusion fragment of the humanised MM type HFE7A light chain and DNA encoding the region of human kappa chain, and is deposited as FERM BP-6071 (Claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), its native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in ormal cells. The humanised antibodies are used to evaluate, in normal cells. The humanised antibodies are used to evaluate, in cormal cells. treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, and proving anamia, and also to treat syndrome, perincious anamia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sterility, myasthenia gravis, multiple sclerosis, Basedow's disease,
thrombopenia purpura and insulin-dependent diabetes), allergies,

The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with FasF the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, aropy, arteriosclerosis, myocarditis, cardiomyopathy.

Glomerulonephritis, anoperation aneamia (panmyelophthisis), hepatitis AIDS and organ graft rejection. Sequences AAB14772-B14778 and AAB14777-B14778

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas induces apoptosis in cells with an abnormal Fas/Fas cliqand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, antialeragic, anti-arthritic, antiviral, immunosuppressive, thyromimetic, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; anti-allergic; anti-arthritic; antiviral; immunomodulatory; cardiant; dermatological; immunosuppressive; thyromimetic; antirheumatic; anti-Fas; nephrotroptc; antinfertility; neuroprotective; antiatreriosolerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility; multiple solerosis; Basedow's disease; sterility; myasthenia gravis; multiple sclerosis; Basedow's disease; thrombopenia purpura; allergy; insulin dependent diabetes mellitus; arteriosolerosis; myocarditis; cardiomyopathy; glomerulonephritis; hepatitis; transplant rejection.

anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune memla, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mallitus, allergy, arteriosolerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (b, C or D) or alcoholio), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-rastantibody HEETA light chain MM type which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                    61 QQKPGQPPKLLIYAASNLESGIPDRFSGSGSGTDFTLTIHPVEEEDAATYYCQQSNEDPR 120

conserved in the human light (kappa) chain. Host cell E. Coli pHSGHM17 SANK 73597 harbors plasmid pHSGHM17 carrying a fusion of fragment of the humanised HM type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERW BP-6072 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematcosus, Hashimoto's disease, calsease, soleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed). This is the amino acid sequence of the HM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A. Humanisation of the murine sequence (see AAW83042) entailed making P47A and K49R amino acid substitutions; these residues are

(complementarity determining regions) to antibody HFETA. Via its interaction with Fast the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, and organ graft rejection. Sequences ABB14772-B14774 and ABB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosmodulatory, dermatological, immunosuppressive, thyromimetic, antistremmatic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

diseases associated with the Fas/Fas ligand system, especially systemic lupus crythematosus. Hashimoto disease, rheumatoid arthritis, graft versus host disease. Hashimoto disease, rheumatoid arthritis, graft versus host disease, soleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, starility, myasthenia gravis, multiple sclerosis, masedow, silease, thrombopenia purpura, insulin dependent diabetes mellitus, alleray, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral CB, Cor D) or alongolic), and transplant rejection. (i) selectively inhibit apoptosis informal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in curine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human and murine disease, and have reduced risk of a humanised anti-reagantibody HEE7A light chain HM type which is used in

chain of murine anti-human Fess monoclonal antibody HFEFA.

CHumanisation of the murine sequence (see AAM83042) entailed making DIE, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host call Escherichia coli pHSHM2 SAMK 70198 harbors plasmid pHSHM2 carrying a fusion of the humanised PDHM type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BF-6272 (claimed). The invention provides choosited as FERM BF-6272 (claimed). The invention provides cells. Humanised versions of HEFA (see AAW83011-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas.Fas ligand interactions, and also to treat such diseases, including autoimmune diseases that such diseases, including autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       used to evaluate drugs in animal models and to treat FSS-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibodies and proteins bind conserved epitope of Fas antigen -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of the PDHM type humanised light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFF7A, or a humanised version of HFF7A containing identical CDRs (complementarity determining regions) to antibody HFF7A. Via its interaction with Fas/F the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, anterioscierosis, myocarditis, cardiomyopathy, and anti-Fas represent the light chains of several humanised HFF7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 238;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-antidiabetic, anti-allergic, anti-arthritic, anti-inflammatory immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antilnfertility, neuroprotective,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas income.

antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand blading. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, Slorgen's syndrome, pernicious or hypoplastic
anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune Hemolytic anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
inhibit apoptosis ininormal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they minic
the native ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
a humanised anti-ras, antibody HEF7A designed light chain which is used in
the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 QOKPGQPPKLLIYAASNLESGIPDRFSGSGSGTDFTLTIHPVEEEDAATYYCQQSNEDPR 120

This is the amino acid sequence of the HH type humanised light

Chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAW8304) entabled making

B47A, K49R, H80S, P81R, W8LL, E84P, E85A, A87F and T89V amino acid

Substitutions; these residues are conserved in the human light

chain (kappa chain). Host cell Escherichia coll pHSGHHT SANK 73497

harbors plasmid pHSGHH7 carrying a fusion fragment of the humanised

HH type HFE7A light chain and DNA encoding the region of human

immunoglobulin kappa chain, and is deposited as FERM BHP-6073

Claimed). The invention provides methods for producing humanised

antibodies by culturing host cells. Humanised versions of HFE7A

capanical and anormal cells expressing Fas, and of inhibiting

poptosis in abnormal cells expressing Fas, and of inhibiting

Fas-Induced apoptosis in normal cells. The humanised antibodies

care used to evaluate, in animal models, treatments of diseases that

involve Fas/Fas ligand interactions, and also to treat such

diseases, including autoimmune disease (e.g. systemic lupus

errythematowns, Hashimoto's disease, graft versus host disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sjögren syndrome, pernicious anaemia, Addison's disease, scletoderma, Goodpasture syndrome, Crohn's disease, rheumatcid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, anayocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFF7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or preferrions of the invention may therefore be used in the treatment or preferrions of conditions such as autoimmune diseases, allergy, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, appastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light. Fas
                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

cc anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, definatological, immunosuppressive, thyromimetic, continuentic, nephrotropic, antininerility, neuroprotective, cantiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce cinhibition of ligangland to cell surface Fas or inhibit it by competitive continues by binding to cell surface Fas or inhibit it by competitive continues associated with the Fas/Fas ligand system, especially systemic diseases associated with the Fas/Fas ligand system, especially systemic cupus erythematosus; Hashimoto disease, rheumatoid arthritis, graft versus host disease, Solorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune menolytic anemia, sterility, myaathenia gravis, mutiple sclerosis, masedow's disease, thrombopenia purpura, insulin dependent diabetes mallitus, allergy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively conthibit apoptosis inflormal cells but selectively induce it in abnormal cells. They bind to; both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human angularmine antibody response. This sequence represents a humanised anti-Fasianthody HEFAA light chain HH type which is used in the method describedin the invention.

```

This is the amino acid sequence of the PDHH type humanised light chain of murine anti-human Fas monoclonal antibody HFETA.

Humanisation of the murine sequence (see AAM8042) entailed making DIE, P47A, K49R, H80S, P81R, V82L, E84P, A87F, T89V and R107K amino acid substitutions; these residues are conserved in the humanised bull kappa chain). Host cell Escherichia coli pHSHH5 SANK 70398 harbors plasmid pHSHH5 carrying a fusion fragment of the humanised PDHH type HFETA light chain and DNA encoding the reacion of human immunoglobulin kappa chain, and is deposited as FERM BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host encoding the reaple of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to earluste, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease, rheumatoid arthritis, autoimmune haemolytic anaemia, disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, mysathenia gravis, multiple scierosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular reference of the partitis, AIDS and transplant references. New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS rejection (all claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFF7A, or a humanised version of HFF7A containing identical CDRs (complementarity determining regions) to antibody HFF7A. Via its interaction with Fasf the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and ABB14777-B14778 represent the light_chains of several humanised HFF7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anti-Fas antibody, monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligadi, apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AlDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody

immunomodulatory, dermatological, immunosuppressive, thyromimetro, antirheumatic, nephrotropic, antinfertility, neuroprotective, antirheumatic, nephrotropic, antinfertility, neuroprotective, cardiant and hepatropic activity. (1) induce antiarteriosclerofic, cardiant and hepatropic activity. (1) induce approssis by binding to call surface Fas or inhibit it by competitive (1) diseases associated/with the Fas/Fas ligand system, especially systemic clupus erythematosus, Hashimoto disease, rehumatoid arthritis, graft versus host disease, Slorgen's syndrome, pernicious or hypoplastic commia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (8), C or D) or alcoholic), and transplant rejection. (1) selectively cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (1) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of humanised anti-Fas antibody HFFA designed light chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  121 TFGQCTRLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180

Batent No. 6172213

GENERAL INFORMATION:

TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of Improving Polypept
FILE REFERENCE: P1123H

CURRENT APPLICATION NUMBER: US/09/109,207C

CURRENT FILING DATE: 01998-06-30
Sequence 24, Application US/08887352B

Patent No. 5994511
GRNERAL INFORMATION:

APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improving Polypeptides

TITLE OF INVENTION: Improving Polypeptides

NUMBER OF SEQUENCES: 26

CORRESPONDENCE ADDRESS:

ADDRESSEE: Genentech, Inc.

STREET: 1 DNA WAY

CITY: South San Francisco
